AI Tools Declaration

Agentic AI (AI4015), Assignment Beta, Question 1 (SaafHawa)

Syed Ukkashah, roll no. 23K-0055, 10 November 2026

I used the following AI tools while preparing this submission. Text in highlighted square brackets is mine to complete or correct before submitting.

Tool	Purpose	What the tool did	My own contribution / verification
Claude Code (Anthropic), Claude Opus models	Research and data collection	Searched provider documentation, pricing and rate-limit pages, the OpenRouter and Hugging Face APIs and Artificial Analysis, and compiled data/models.csv and data/sources.csv with a source tag for every value.	[Which figures I checked against the source pages myself; the AutomationBench-AA and Terminal-Bench values were read from my own screenshots of the AA leaderboard.]
Claude Code	Code	Wrote latency_logger.py (OpenAQ, Open-Meteo, heat-index and knowledge-base tools plus the timing logger), the notebook generator build/build_q1.py and the report builder build/build_report.py.	[I ran the logger myself on both days with my own OpenAQ key, executed the notebook and checked the outputs.]
Claude Code	Calculations and analysis	Implemented the Section 2 formulas (token volume, caching cost, peak load, KV cache, break-even, latency) in the notebook following the assignment's assumptions.	[I checked the parameter derivation from my roll number and re-did selected calculations by hand, e.g. …]
Claude Code	Writing	Drafted the report text and tables from the notebook outputs, and this declaration.	[I reviewed and edited the report; the conclusions and recommendation are ones I agree with and can defend.]
[Any other tool, e.g. ChatGPT, Grammarly, Copilot – or delete this row]	[Purpose]	[What it did]	[How I checked it]

All numbers in the report are produced by the submitted notebook from the submitted data files and timing log, and every external figure is cited to its source. I understand the work and take responsibility for its correctness.
